INTRODUCTION TO CO₂ MEASUREMENTS IN SEA WATER

ANDREW G. DICKSON
SCRIPPS INSTITUTION OF OCEANOGRAPHY, UC SAN DIEGO

METHODS FOR MEASURING THE CO₂ PARAMETERS IN SEA WATER

USUAL PARAMETERS MEASURED

Total dissolved inorganic carbon

$$C_{\rm T} = [{\rm CO}_2] + [{\rm HCO}_3^-] + [{\rm CO}_3^{2-}]$$

Total hydrogen ion concentration (pH)

$$pH = -\lg [H^+]$$

• Partial pressure of CO₂ (in air in equilibrium with sea water)

$$p(CO_2) = x(CO_2) p = [CO_2] / K_0$$

Total alkalinity

$$A_{\rm T} = [{\rm HCO_3^-}] + 2[{\rm CO_3^{2-}}] + [{\rm B(OH)_4^-}] + [{\rm OH^-}] - [{\rm H^+}]$$

	Advantages	Disadvantages
C_{T}	T, p independent Unambiguous interpretation of changes	Needs care with sample handling No autonomous system available
pН	Autonomous systems available Master variable?	Function of <i>T</i> , <i>p</i> Needs care with sample handling Interpretation problems
$p(CO_2)$	Autonomous systems available	Function of <i>T</i> , <i>p</i> Changes not easy to interpret
$A_{ m T}$	T, p independent Often possible to interpret changes	No autonomous system available Harder to interpret in some systems

TOTAL DISSOLVED INORGANIC CARBON

Carbon dioxide mass balance equation

$$C_{\rm T} = [{\rm CO}_2] + [{\rm HCO}_3^-] + [{\rm CO}_3^{2-}]$$
 T, p independent

UNITS: moles per kilogram of solution (usually µmol kg⁻¹)

TOTAL DISSOLVED INORGANIC CARBON

Carbon dioxide mass balance equation

$$C_{\rm T} = [{\rm CO}_2] + [{\rm HCO}_3^-] + [{\rm CO}_3^{2-}]$$

T, p independent

- I. Acidify a known amount of sample
- 2. Extract the CO₂
- 3. Measure the amount of CO₂
 - Coulometry
 - Infra-red analyzer
 - Other

COMPARISON OF TECHNIQUES

	Advantages	Disadvantages
IR system	Cheaper system Faster sample throughput Less waste disposal Less start-up time Smaller sample ?	Lower reproducibility Calibration not v. stable Limited collaborative testing as yet
Coulometry system	Higher reproducibility Stable calibration Well tested in many labs	Slower sample throughput Proprietary coulometer solution (hazardous) Significant start-up time needed

TOTAL HYDROGEN ION CONCENTRATION (PH)

• Species concentration, [H+]

$$pH = -\lg [H^+]$$

T, p dependent

UNITS: pH is dimensionless

But, total hydrogen ion concentration is in moles per kilogram of solution

TOTAL HYDROGEN ION CONCENTRATION (PH)

• Species concentration, [H+]

$$pH = -\lg [H^+]$$

T, p dependent

- I. Electrometric measurement of pH
- 2. Spectrophotometric measurement of pH

ELECTROMETRIC PH MEASUREMENT

A direct electrometric technique using an electrode sensitive to hydrogen ion in a "pH cell";

The Nernst equation underlies this approach to measuring pH:

$$E = E^*(S, T, p) - \left(\frac{RT\ln 10}{F}\right) \lg[H^+]$$

$$= E^*(S, T, p) + \left(\frac{RT\ln 10}{F}\right) pH$$

$$pH(X) = pH(S) - \frac{E_X - E_S}{RT\ln 10/F}$$

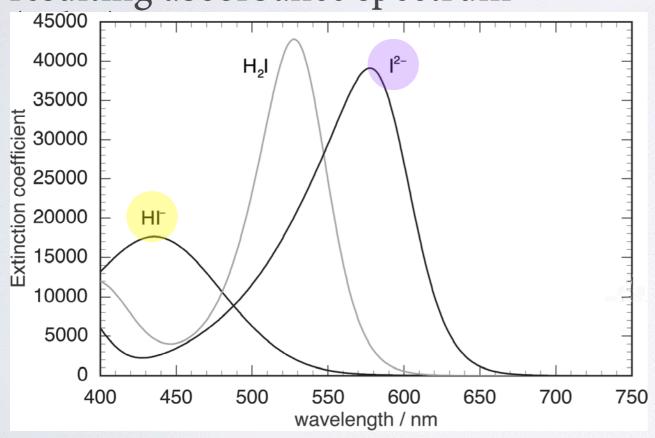

For this operational approach to give an accurate estimate of [H+], it is essential that the calibration standard be matched closely to the sample in composition.

IT RARELY IS!

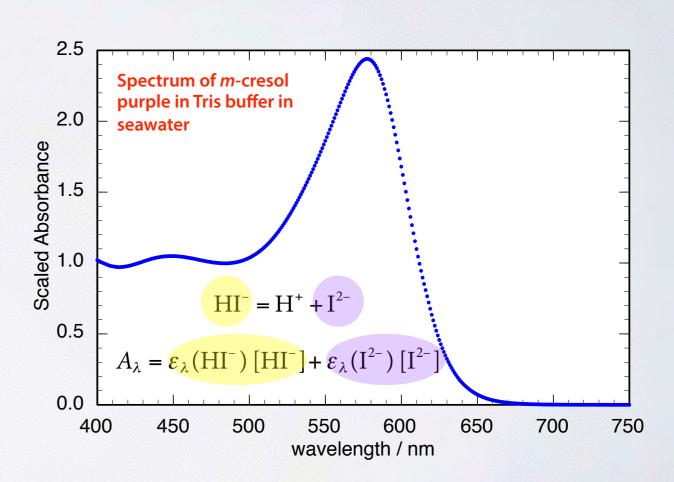

To use autonomously (not constant S, T, p), it is essential that the functional form of $E^*(S, T, p)$ be known well.

SPECTROPHOTOMETRIC PH MEASUREMENT

A colorimetric technique in which an indicator dye is added to the solution and the pH inferred from the resulting absorbance spectrum

$$pH = -\lg K(HI^{-}) \left(\frac{\varepsilon_{1}(I^{2-})}{\varepsilon_{2}(HI^{-})} \right) + \lg \left(\frac{A_{1}/A_{2} - \varepsilon_{1}(HI^{-})/\varepsilon_{2}(HI^{-})}{1 - (A_{1}/A)\varepsilon_{2}(I^{2-})/\varepsilon_{1}(I^{2-})} \right)$$

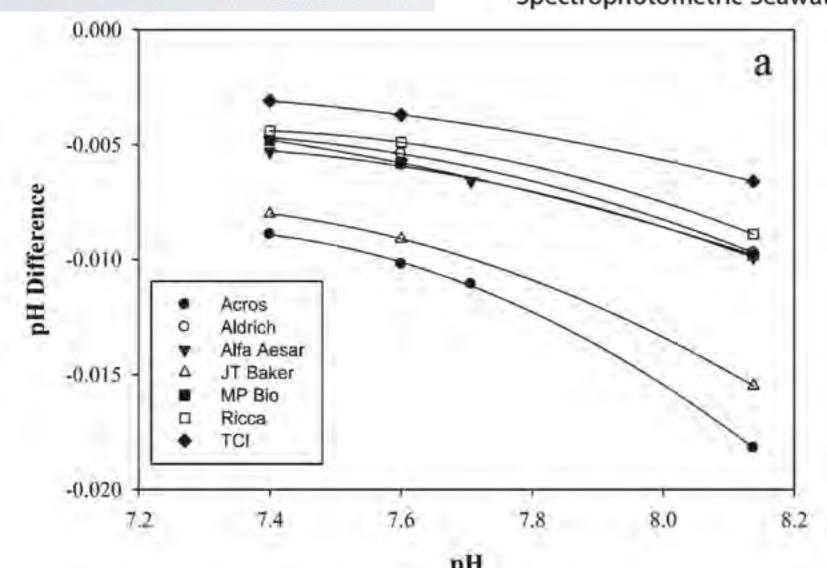

POTENTIAL IMPLICATIONS OF IMPURE DYE

Purification and Characterization of meta-Cresol Purple for Spectrophotometric Seawater pH Measurements

4. Byrne*

, 140 Seventh Avenue South, St. Petersburg, Florida 33701, United States

pid and precise measurements acid—base indicators used in ccuracy. This work describes eta-cresol purple (mCP), and modynamic equilibrium consperature (T) and salinity (S), on concentration scale (pH_T) nce ratios $(R = \frac{1}{A_1}A/A_1A)$ as

Thus far the uncertainty introduced by dye impurities has only been characterized at a single temperature (25 °C) and salinity (35).

COMPARISON OF TECHNIQUES

	Equipment Cost	Ease of use	Uncertainty in best labs
Electrometric pH cell	Relatively cheap (need T control)	Simple to use, needs regular recalibration*	0.02 limited availability of RMs
Using indicator & spectrophotometer	Mid-range k\$ 10–25	Can be automated	< 0.01 limited availability of pure mCP

^{*} The Honeywell DuraFET® seems to have a significantly more stable calibration than a conventional pH cell.

PARTIAL PRESSURE OF CO₂ (IN AIR THAT IS IN EQUILIBRIUM WITH THE WATER SAMPLE)

• Species concentration, [CO₂]

$$CO_2(g) = CO_2(aq)$$
 $K_0(T, p, S) = \frac{[CO_2]}{x(CO_2) \cdot p}$ mole fraction of CO_2

$$p(CO_2) = x(CO_2) p = [CO_2] / K_0$$

T, p dependent

UNITS: pressure units (usually µatm)

PARTIAL PRESSURE OF CO₂ (IN AIR THAT IS IN EQUILIBRIUM WITH THE WATER SAMPLE)

• Species concentration, [CO₂]

$$p(CO_2) = x(CO_2) p = [CO_2] / K_0$$

T, p dependent

- A. Gas phase equilibration
 - Measure $x(CO_2)$ in the gas phase using NDIR
 - Measure $x(CO_2)$ in the gas phase using GC
- B. Membrane equilibration (with gas or external solution)
 - Measure $x(CO_2)$ in the gas phase using NDIR
 - Measure pH in external solution (see pH section)

COMPARISON OF TECHNIQUES

	Equipment Cost	Advantages / Disadvantages	Uncertainty*
infra-red analyzer	\$30,000 - \$60,000	Quality depends mostly on design of equilibrator	With careful calibration < 0.5%
pH-based analyzer	~\$25,000	Awkward to calibrate Membrane can foul	Can be 1–2%

^{*} These values are for commercial systems when working well.

TOTAL ALKALINITY

$$A_{\rm T} = [{\rm HCO_3^-}] + 2[{\rm CO_3^{2-}}] + [{\rm B(OH)_4^-}] + [{\rm OH^-}] - [{\rm H^+}]$$

T, p independent

UNITS: moles per kilogram of solution (usually µmol kg⁻¹)

TOTAL ALKALINITY

Hydrogen ion mass-balance equation

$$A_{\rm T} = [{\rm HCO_3^-}] + 2[{\rm CO_3^{2-}}] + [{\rm B(OH)_4^-}] + [{\rm OH^-}] - [{\rm H^+}]$$
 T, p independent

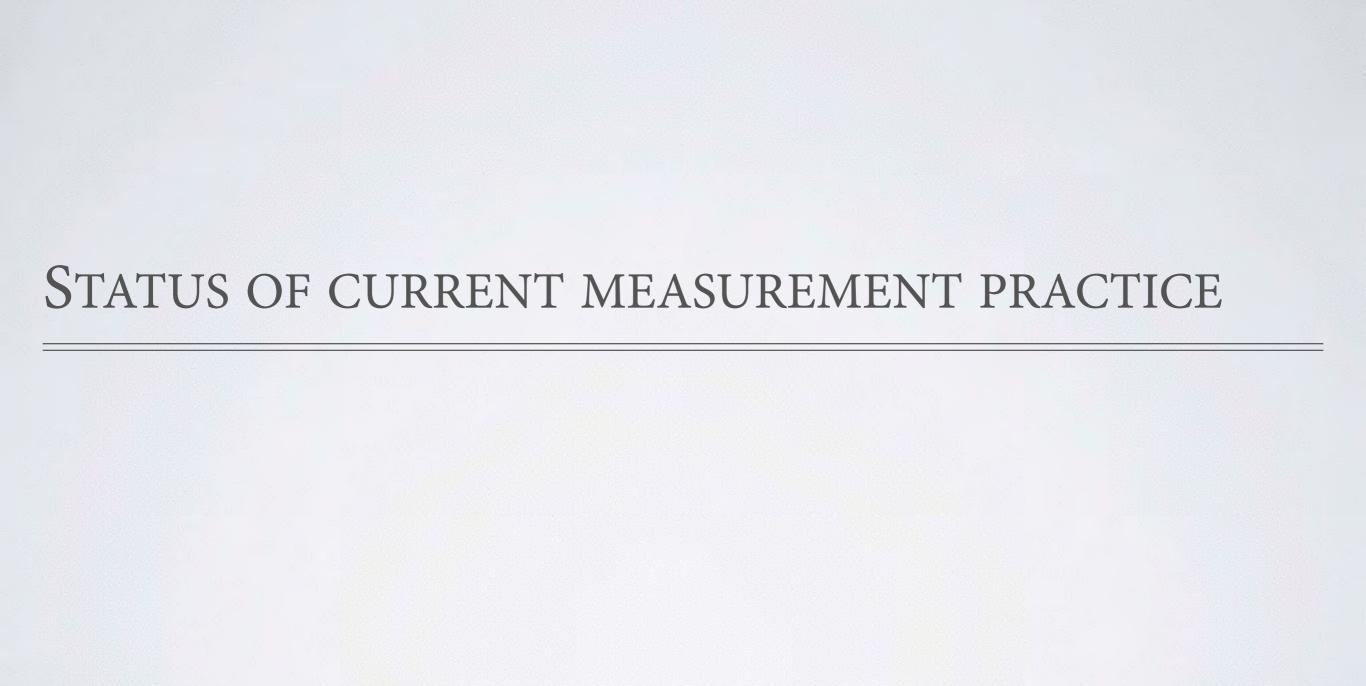

Acidimetric titration

- Closed-cell
- Open-cell
- a. Can also add acid in one aliquot (single point method)
- b. Can use either a pH cell or spectrophotometry to estimate [H+] during titration.
- c. Ideally use NLLS to locate equivalence point; can use Gran technique

COMPARISON OF TECHNIQUES

	Equipment Cost	Advantages / Disadvantages	Uncertainty*
Closed cell	~\$30,000	Uses cell to measure <i>V</i> Problems with back-pressure	~2-4 µmol kg ⁻¹
Open cell	\$15,000 to \$30,000	Can be very precise Easier to diagnose faults	~1-4 µmol kg ⁻¹

^{*} These values are for commercial systems when working well.

SAMPLING & ANALYSIS STRATEGIES

Discrete samples (collected from desired locations, preserved, then analyzed later in a laboratory)

Automated on-line analysis (e.g. a stream of sea water pumped into the instrument)

Instruments operated in a profiling mode, e.g. as part of a CTD package

Autonomous instruments able to carry out their analyses remotely in the ocean

DEVELOPMENT STATE OF CO2 MEASUREMENT SYSTEMS

- Level 0 No working system available
- Level 1 Prototype system available in single lab
- Level 2 2nd generation prototype in use
- Level 3 Home-built systems in a number of labs
- Level 4 Can be purchased commercially
- Level 5 Commercially available, reliable, and fully supported

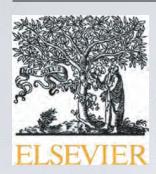

DEVELOPMENT STATE OF CO₂ MEASUREMENT SYSTEMS

	Discrete samples	Autonomous sampling & analysis	Profiling instrument	Remote instruments in ocean
C_{T}	3/4/5?	1/2	0	0/1
pН	3/4	3/4/5?	1/2	3/4/5?
$p(CO_2)$	2	3/4/5	1	3/4/5
A_{T}	3/4/5?	1/4	0	0/1

ESTIMATED UNCERTAINTIES† FOR DISCRETE MEASUREMENTS

	State-of-the-art laboratory	State-of-the-art at-sea lab (suitable RMs)	Other laboratories (suitable RMs)	Laboratories not using RMs
C_{T}	1.0 μmol kg ⁻¹	2 μmol kg ⁻¹	4–10 μmol kg ⁻¹	?.
рН	0.010 (0.003 ?)	0.010 (0.003 ?)	0.01-0.05	•
p(CO ₂) IR-based	1.0 µatm	2 µatm	5–10 µatm	?
$A_{ m T}$	1.2 μmol kg ⁻¹	2 μmol kg ⁻¹	4–10 μmol kg ⁻¹	?

ABSTRACT

Seawater CO₂ measurements are being made with increasing frequency as interest grows in the ocean's response to changing atmospheric CO₂ levels and to climate change. The ultimate usefulness of these measurements depends on the data quality and consistency. An inter-laboratory comparison was undertaken to help evaluate and understand the current reliability of seawater CO₂ measurements. Two seawater test samples of different CO₂ content were prepared according to the usual method for the creation of seawater reference materials in the Dickson Laboratory at Scripps Institution of Oceanography. These two test samples were distributed in duplicate to more than 60 laboratories around the world. The laboratories returned their measurement results for one or more of the following parameters: total alkalinity (A_T) , total dissolved inorganic carbon (C_T) , and pH, together with information about the methods used and the expected uncertainty of the measurements. The majority of laboratories reported A_T and C_T values for all their measurements that were within 10 μ mol kg⁻¹ of the assigned values (i.e. within $\pm 0.5\%$), however few achieved results within 2 µmol kg⁻¹ (i.e. within $\pm 0.1\%$), especially for C_T. Results for the analysis of pH were quite scattered, with little suggestion of a consensus value. The high- CO_2 test sample produced results for both C_T and pH that suggested in many cases that CO_2 was lost during analysis of these parameters. This study thus documents the current quality of seawater CO₂ measurements in the various participating laboratories, and helps provide a better understanding of the likely magnitude of uncertainties in these measurements within the marine science community at the present time. Further improvements will necessarily hinge on adoption of an improved level of training in both measurement technique and of suitable quality control procedures for these measurements.

Assigned values for total alkalinity, total dissolved inorganic carbon, and pH (25 °C; total scale) for the two test samples. Values are expressed as $mean \pm standard\ deviation\ (number\ of\ analyses)$.

	Batch A	Batch B
Salinity	33.190	33.186
Total alkalinity	2215.08 ± 0.49 (24) μmol kg ⁻¹	2216.26 ± 0.52 (18) μmol kg ⁻¹
Total dissolved inorganic carbon	2015.72 ± 0.74 (9) μmol kg ⁻¹	2141.94 ± 0.37 (6) μmol kg ⁻¹
pH (25 °C; total scale)	7.8796 ± 0.0019 (18)	$7.5541 \pm 0.0020 (18)$

Normal RM

High-CO₂ RM

FASTER, BETTER, CHEAPER

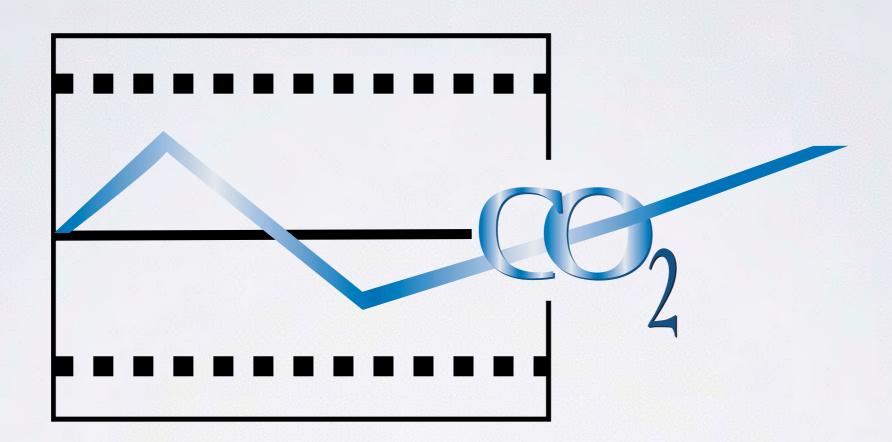

In 1992, NASA Administrator Daniel Goldin began the agency's "Faster, Better, Cheaper" initiative.

The popular consensus on "Faster, Better, Cheaper" is often expressed in the supposedly self-evident saying: "faster, better, cheaper — pick two."

Is this necessarily true for seawater carbonate system measurements?

We clearly understand the meanings of "faster" and "cheaper", but how should we define "better"?

DESIRE FOR HIGH-QUALITY MEASUREMENTS

WHAT IS QUALITY?

Quality is fitness for purpose.

Fitness for purpose: the property of data produced by a measurement process that enables a user of the data to make technically correct decisions for a stated purpose.

Fitness for purpose therefore refers to the magnitude of the uncertainty associated with a measurement in relation to the needs of the application area.

Has implications for the level of resources needed!

WHEN ASSESSING "BETTER", UNCERTAINTY IS NOT THE ONLY MEASURE!

YOU SHOULD CONSIDER:

- 1. Overall uncertainty required
- 2. Cost of measurement(s)
 - a. Cost of equipment (purchase / maintenance)
 - b. Cost of training
 - c. Cost of analysis (time & materials)
- 3. Convenience of measurement
 - a. Availability of equipment (purchase / maintenance)
 - b. Sample size required
 - c. Time until results are available
- 4. Cost of making a wrong measurement.

http://cdiac.ornl.gov/oceans/Handbook_2007.html

FOR OPEN-OCEAN MEASUREMENTS

YOU SHOULD CONSIDER:

1. Overall uncertainty required

AS GOOD AS POSSIBLE!

2. Cost of measurement(s)

MONEY NO OBJECT?

- a. Cost of equipment (purchase / maintenance)
- b. Cost of training
- c. Cost of analysis (time & materials)
- 3. Convenience of measurement

WOULD BE NICE!

- a. Availability of equipment (purchase / maintenance)
- b. Sample size required
- c. Time until results are available
- 4. Cost of making a wrong measurement. Very High!

FOR OCEAN ACIDIFICATION MEASUREMENTS

YOU SHOULD CONSIDER:

1. Overall uncertainty required

STILL NEEDS THOUGHT

2. Cost of measurement(s)

- BE NICE IT IT WERE CHEAP!
- a. Cost of equipment (purchase / maintenance)
- b. Cost of training
- c. Cost of analysis (time & materials)
- 3. Convenience of measurement

PLEASE!!

- a. Availability of equipment (purchase / maintenance)
- b. Sample size required
- c. Time until results are available
- 4. Cost of making a wrong measurement. Needs thought

KEY QUESTIONS TO ASK ABOUT ANY ANALYTICAL METHOD

KEY QUESTIONS

- 1. How does the method work?
- 2. How is it calibrated?
- 3. What is the overall uncertainty of the measured value?
- 4. Does it provide the quality I need?
- 5. What does the method cost to use?
